

The RMS Titanic was a British ocean liner that struck an iceberg and sank on April 15, 1912, during its maiden voyage from Southampton to New York City.

The ship was 269 metres long and was considered unsinkable due to its 16 watertight compartments, but the iceberg damaged five of them simultaneously.

Of the 2,224 passengers and crew on board, only 710 survived, largely because the ship carried only 20 lifeboats — enough for roughly half the people on board.

The wreck was discovered on September 1, 1985, by oceanographer Robert Ballard, lying at a depth of 3,800 metres in the North Atlantic Ocean.
